N
[C] Brief summary of the Invention

10
K
This invention relates in general to a new and improved methodology/system for the electronic sales, distribution, storage, manipulation, retrieval, playback, and copyright protection of Digital Audio Music.

P
The three basic mediums (hardware units) of music: records, tapes, and compact discs, greatly restricts the transferability of music and results in a variety of inefficiencies.

15 CAPACITY: The individual hardware units as cited above are limited as to the amount of music that can be stored on each.

5

MATERIALS: The materials used to manufacture the hardware units are subject to damage and deterioration during normal operations, handling, and exposure to the elements.

5 SIZE: The physical size of the hardware units imposes constraints on the quantity of hardware units which can be housed for playback in confined areas such as in automobiles, boats, planes, etc.

10 RETRIEVAL: Hardware units limit the ability to play, in a sequence selected by the user, songs from different albums. For example, if the user wants to play one song from ten different albums, the user would spend an inordinant amount of time handling, sorting, and cueing the ten different hardware units. ✓

15 SALES AND DISTRIBUTION: Prior to final purchase, hardware units need to be physically transfered from the manufacturing facility to the wholesale warehouse to the retail warehouse to the retail outlet, resulting in lengthly lag time between music creation and music marketing, as well as incurring unnessary and inefficient transfer and handling costs. Additionally, tooling costs required for mass production of the hardware units and the material cost of the hardware units themselves, further drives up the cost of music to the end user. ✓

20

QUALITY: Until the recent invention of Digital Audio Music, as used on Compact Discs, distortion free transfer from the hardware units to the stereo system was virtually impossible.

Digital Audio Music is simply music converted into a very basic computer language known as binary. A series of commands known as zeros or ones encode the music for future playback. Use of laser retrieval of the binary commands results in distortion free transfer of the music from the compact disc to the stereo system.

Quality Digital Audio Music is defined as the binary structure of the Digital Audio Music. Conventional analog tape recording of Digital Audio Music is not to be considered quality inasmuch as the binary structure itself is not recorded. While Digital Audio Music on compact discs is a technological breakthrough in audio quality, the method by which the music is sold, distributed, stored, manipulated, retrieved, played and protected from copyright infringements remains as inefficient as with records and tapes.

COPYRIGHT PROTECTION: Since the invention of tape recording devices, strict control and enforcement of copyright laws have proved difficult and impossible with home recorders.

Additionally, the recent invention of Digital Audio Tape Recorders now jeopardizes the electronic copyright protection of quality Digital Audio Music on Compact Discs or Digital Audio Tapes. If music exists on hardware units, it can be copied.

Accordingly, it is an objective of this invention is to provide a new and improved methodology/system to electronically sell and distribute Digital Audio Music. ✓

5 A further objective of this invention [✓] to provide a new and improved methodology/system to electronically store and retrieve Digital Audio Music. ✓

Another objective of this invention is to provide a new and improved methodology/system to electronically manipulate, i.e., sort, cue, and select, Digital Audio Music for playback. ✓

10 Still another objective of this invention is to offer a new and improved methodology/system which can prevent unauthorized electronic copying of quality Digital Audio Music.

△ ~~12~~ ~~13~~ ~~14~~ ~~15~~ ~~16~~
Briefly, this invention accomplishes the above cited objectives by providing a new and improved methodology/system of
15 electronic sales, distribution, storage, manipulation, retrieval, playback, and copyright protection of Digital Audio Music. The high speed transfer of Digital Audio Music as prescribed by this invention is stored onto one piece of hardware, a hard disk, thus eliminating the need to unnecessarily handle records, tapes, or
20 compact discs on a regular basis. / This invention recalls stored music for playback as selected/programmed by the user. This ✓

invention can easily and electronically sort stored music based on many different criteria such as, but not limited to, music

category, artist, album, user's favorite songs, etc. An additional feature of this invention is the random playback of songs, also based on the user's selection. For example, the user could have this invention randomly play all jazz songs stored on the user's hard disk, or randomly play all songs by a certain artist, or randomly play all of the user's favorite songs which the user previously electronically "tagged" as favorites.

Further, being more specific, the user can electronically select a series of individual songs from different albums for sequential playback.

This invention can be configured to either accept direct input of Digital Audio Music from the digital output of a Compact Disc, such transfer would be performed by the private user, or this invention can be configured to accept Digital Audio Music from a source authorized by the copyright holder to sell and distribute the copyrighted materials, thus guaranteeing the protection of such copyrighted materials. Either method of electronically transferring Digital Audio Music by means of this invention is intended to comply with all copyright laws and restrictions and any such transfer is subject to the appropriate authorization by the copyright holder. Inasmuch as Digital Audio Music is software and this invention electronically transfers and

stores such music, electronic sales and distribution of the music
can take place via telephone lines onto a hard disk. This new
methodology/system of music sales and distribution will greatly
reduce the cost of goods sold and will reduce the lag time
5 between music creation and music marketing from weeks down to
hours.

Ans 14 → Further objectives and advantages of this invention will
become apparent as the following description proceeds and the
particular features of novelty which characterize this invention
10 will be pointed out in the claims annexed to and forming a part
of this declaration.

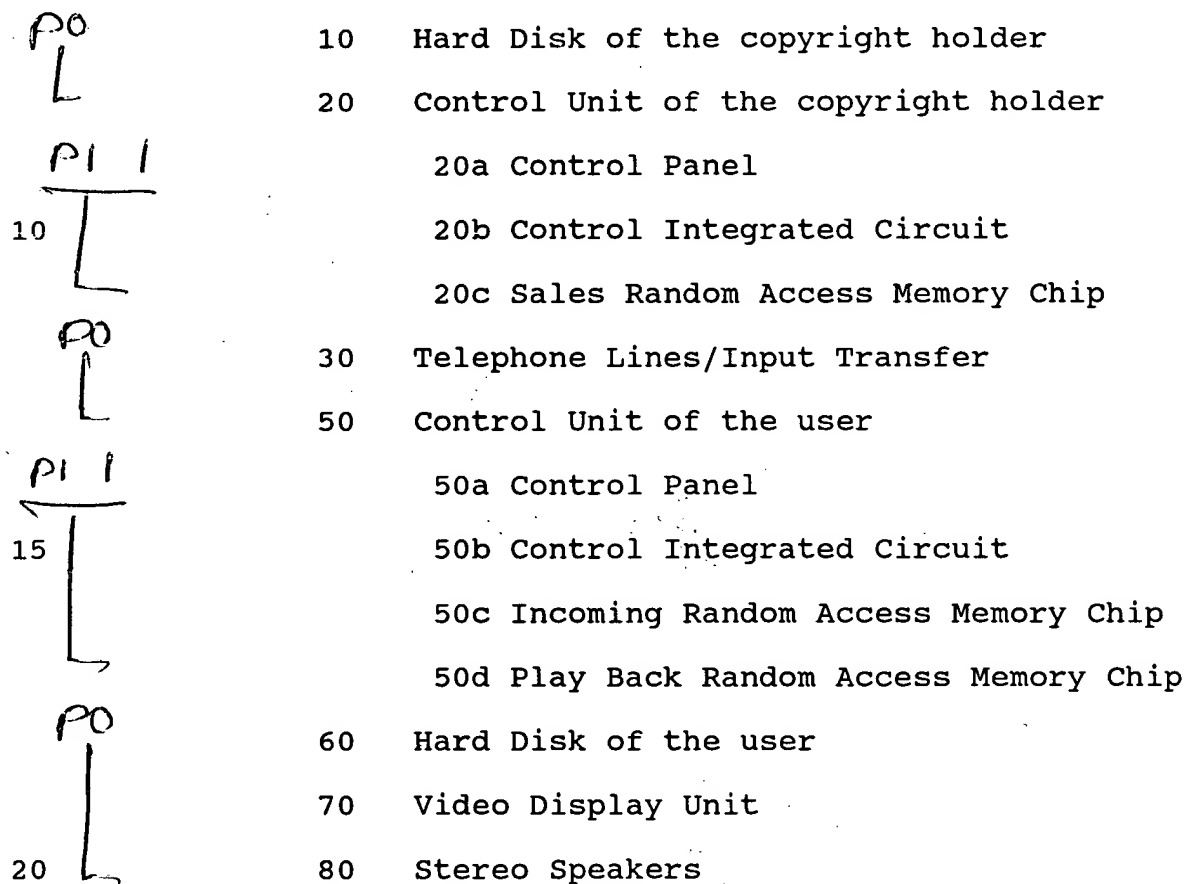

Drawn [D] Brief Description of the Several Views of Drawings

P For a better understanding of this invention, reference
should be made to the following detailed description, taken in
15 conjunction with the accompanying drawings, in which:

Fig. 1 is a pictorial flow chart which may be used in
carrying out the teachings of this invention for the purposes of
electronic sales, distrubution, storage, manipulation, retrieval,
playback, and copyright protection of Digital Audio Music; and ✓

Fig. 2 is a pictorial flow chart which may be used in carrying out the teachings of this invention for the purposes of electronic storage, manipulation, retrieval, and playback of Digital Audio Music.

Referring now to the Fig. 1, this invention is comprised of the following:

The Hard Disk 10 of the agent authorized to electronically sell and distribute the copyrighted Digital Audio Music is the

originating source of music in the configuration as outlined in Fig. 1. The Control Unit 20 of the authorized agent is the means by which the electronic transfer of the Digital Audio Music from the agent's Hard Disk 10 via the Telephone Lines 30 to the user's Control Unit 50 is possible. The user's Control Unit would be comprised of a Control Panel 50a, a Control Integrated Circuit 50b, an Incoming Random Access Memory Chip 50c, and a Play Back Random Access Memory Chip 50d. Similarly, the authorized agent's Control Unit 20 would have a control panel and control integrated circuit similar to that of the user's Control Unit 50. The authorized agent's Control Unit 20, however, would only require the Sales Random Access Memory Chip 20c. The other components in Fig. 1 include a Hard Disk 60, a Video Display Unit 70, and a set of Stereo Speakers 80.

Referring now to Fig. 2, with the exception of a substitution of a Compact Disc Player 40 (as the initial source of Digital Audio Music) for the agent's Hard Disk 10, the agent's Control Unit 20, and the Telephone Lines 30 in Fig. 1, Fig. 2 is the same as Fig. 1.

In Fig. 1 and Fig. 2, the following components are already commercially available: the agent's Hard Disk 10, the Telephone Lines 30, the Compact Disc Player 40, the user's Hard Disk 60, the Video Display Unit 70, and the Stereo Speakers 80. The

Control Units 20 and 50, however, would be designed specifically to meet the teachings of this invention. The design of the control units would incorporate the following functional features:

B 5 | 1) the Control Panels 20a and 50a would be designed to permit the agent and user to program the respective Control Integrated Circuits 20b and 50b,

B | 2) the Control Integrated Circuits 20b and 50b would be designed to control and execute the respective commands of the agent and user and regulate the electronic transfer of Digital Audio Music throughout the system, additionally, the sales Control Integrated Circuit 20b could electronically code the Digital Audio Music in a configuration which would prevent unauthorized reproductions of the copyrighted material,

A 15 | 3) the Sales Random Access Memory Chip 20c would be designed to temporarily store user purchased Digital Audio Music for subsequent electronic transfer via telephone lines to the user's Control Unit 50,

B | 4) the Incoming Random Access Memory Chip 50c would be designed to temporarily store Digital Audio Music for subsequent electronic storage to the user's Hard Disk 60,

B1
5) the Play Back Random Access Memory Chip 50d would be designed to temporarily store Digital Audio Music for sequential playback.

The foregoing description of the Control Units 20 and 50 is intended as an example only and thereby is not restrictive with respect to the exact number of components and/or its actual design.

4
~~[E] Detailed description~~

P
103 Once the Digital Audio Music has been electronically stored onto the user's Hard Disk 60, having the potential to store

literally thousands of songs, the user is free to perform the many functions of this invention. To play a stored song, the

1 user types in the appropriate commands on the Control Panel 50a, and those commands are relayed to the Control Integrated Circuit

15 50b which retrieves the selected song from the Hard Disk 60.

When a song is retrieved from the Hard Disk 60 only a replica of the permanently stored song is retrieved. The permanently stored song remains intact on the Hard Disk 60, thus allowing repeated

1 playback. The Control Integrated Circuit 50b stores the replica

20 onto the Play Back Random Access Memory Chip 50d at a high

1 transfer rate. The Control Integrated Circuit 50b then sends the electronic output to the Stereo Speakers 80 at a controlled rate

using the Play Back Random Access Memory Chip 50d as a temporary staging point for the Digital Audio Music.

Unique to this invention is that the Control Unit 50 also serves as the user's personal disk jockey. The user may request specific songs to be electronically cued for playback, or may request the Control Unit 50 to randomly select songs based on the user's criteria. All of these commands are electronically stored in random access memory enabling the control unit to remember prior commands while simultaneously performing other tasks requested by the user and, at the same time, continuing to play songs previously cued.

Offering a convenient visual display of the user's library of songs is but one more new and improved aspect of this invention. As the Control Unit 50 is executing the user's commands to electronically sort, select, randomly play, etc., the Video Display Screen 70 is continually providing feedback to the user. The Video Display Screen 70 can list/scroll all songs stored on the Hard Disk 60, list/scroll all cued songs, display the current command function selected by the user, etc. Further expanding upon the improvements this invention has to offer, the Video Display Screen 70 can display the lyrics of the song being played, as well as the name of the song, album, artist, recording company, date of recording, duration of song, etc. This is

possible if the lyrics and other incidental information are electronically stored to the Hard Disk 60 with the Digital Audio Music.

Copyright

In summary, there has been disclosed a new and improved methodology/system by which Digital Audio Music can be electronically sold, distributed, transferred, and stored. Further, there has been disclosed a new and improved methodology/system by which Digital Audio Music can be electronically manipulated, i.e., sorted, cued, and selected for playback. Further still, there has been disclosed a new and improved methodology/system by which the electronic manipulation of Digital Audio Music can be visually displayed for the convenience of the user. Additionally, there has been disclosed a new and improved methodology/system by which electronic copyright protection of quality Digital Audio Music is possible through use of this invention.

A ~~[P] Claims~~

Since numerous changes may be made in the above described process and apparatus and different embodiments of the invention may be made without departing from the spirit thereof, it is intended that all matter contained in the foregoing description or shown in the accompanying drawings shall be interpreted as

illustrative, and not in a limiting sense. Further, it is intended that this invention is not to be limited to Digital Audio Music and can include Digital Video, Digital Commercials, and other applications of digital information.

7 Claims

pages 6 and 12 are based on the language of the claims. These added paragraphs are allowable for the previously argued reasons why the claim language is allowable. That is, essentially, no new matter has been added. Rather, the claim language clarifies the intended function of the applicant's invention, as explained in the originally filed specification.

Claims 11 and 15 are rejected under 35 U.S.C. §112, second paragraph, for failing to particularly point out and distinctly claim the subject matter which the applicant regards as the invention. The objectionable phrase "at a location remote from the second memory" is acceptable since by definition, the memories are at different locations and by being connected by telecommunication lines have to be remote. The Examiner has also stated that the "telecommunication link" is not well connected in the system. Accordingly, "link" has been amended to the more familiar term "line" and "via a telephone line" has been added to the connecting step in Claims 11 and 15.

Applicant's invention is a method for transmitting a desired digital, video or audio signal stored on a first memory of a first party to a second memory of a second party. The method comprises the steps of transferring money electronically via a telecommunications line to the first party from the second party. Additionally, the method comprises the step of then

connecting electronically via a telecommunications line the first memory with the second memory such that the desired digital signal can pass therebetween. Next, there is the step of transmitting the desired digital signal from the first memory with a transmitter in control and in possession of the first party to a receiver having the second memory at a location determined by the second party. The receiver is in possession and in control of the second party. There is also the step of then storing the digital signal in the second memory.

The Examiner has rejected Claims 11-13, 15 and 21 under 35 U.S.C. §103 as being anticipated by Hughes. Applicant respectfully traverses this rejection.

Referring to Hughes, there is disclosed a coin operated recording machine (200). The machine (200) has a transmitting station (202) where the audio/video records are stored. There are also remote recording stations (204) where the customer can record the station's audio/video signal onto a magnetic tape. The transmitting station (202) may be situated at any convenient central location, and the recording stations (204) may be located in private houses. The transmitting station (202) and recording stations (204) are linked by telephone lines or other signal transmission means.

In all the teachings of Hughes, the user inserts coins into the remote recording stations (204) in order to activate transferral of the desired digital signal over the telephone lines. This is clearly supported by the fact that the user "records new programs at any time they wish . . . by inserting the appropriate coins into the apparatus" (column 9, lines 54-56). Accordingly, the recording machine (200) of Hughes requires its owner or representative thereof to travel to the remote recording stations (204) to collect the coins: much in the same manner as an arcade game owner travels to collect coins in his or her machines.

There is simply no teaching or suggestion within Hughes of "transferring money electronically via a telecommunications line to the first party from the second party", as disclosed in applicant's newly amended Claims 11 and 15.

"Transferring money electronically via a telecommunications line to the first party from the second party" is critical to the operation of the applicant's invention. The step of transferring the money over telecommunication lines eliminates the need for the collection step of the first party or its representative from having to go to the second memory and collect the money deposited therein, which is required by Hughes. With the applicant's method, the money or fee is transferred to

the first party over telecommunications lines. In this manner, the user can use other forms of monies, besides coins, such as credit cards, charge accounts, debit cards or the like. The user is not burdened with the task of saving the appropriate coins and the owner is not burdened by having to come and collect the coins.

Most importantly, the user is free to choose the location where he desires to have the digital signal transferred to him, essentially only requiring a telephone access be present which in this day and age is essentially everywhere.

A second clear distinction between the applicant's method and Hughes' teachings is that the applicant's method in no manner necessitates the need for a receiver which is controlled by the controller of the transmitter. Any suitable memory device controlled and in possession of the second party can be used to record the incoming digital signals. Accordingly, the second party's own stereo system can be coupled to the incoming signals for recording. In this manner, the second party is not limited to a predesigned receiver of the first party controlling the transmitter, but instead can alter the recording components, change recording media, equalize the signal and many other parameters of the system.

Accordingly, since Hughes does not teach or suggest the step of "transferring money via a telecommunications line to the first party from the second party", Claims 11 and 15 are patentable over Hughes. Claims 12, 13, 21 and 22 are dependent to Claims 11 and 15 and have all of their limitations. Therefore, Claims 12, 13, 21 and 22 are also patentable.

With respect to newly added Claim 23, it has the limitation of "electronically selling via a telecommunication line a digital signal possessed by the first party to the second party . . . For the reasons identified above with respect to Claims 11 and 15, Hughes does not teach or suggest to electrically sell via telecommunication lines digital signals.

Lastly, even though Lightner, U.S. Patent 3,718,906 is currently not a basis of rejection of the claim, it has been in the past. With respect to new Claim 23, Lightner on column 8, lines 15-65 teaches that currency or a credit card is inserted into the vending machine. Once the proper amount of currency is received at receiver 91, then switch relay 96 is energized and connects the telephone dial lines for the vending machine to conventional touch tone dialing device 15. Thus, there is no electronic sales via telecommunication lines for the digital signal. The sale is taught in Lightner to be strictly either credit card or currency sale at the vending machine. There is no

teaching or suggestion of using telephone or telecommunication lines with respect to the sales aspect in Lightner.

Only after the proper currency is received by the vending machine do the telephone dial lines connect as indicated in lines 48-53 of column 8 of Lightner. When this happens, the customer can then push an appropriate combination of buttons of a touch tone device 15 to select whatever master tape the customer wishes to duplicate at the vending machine. See lines 60-65 of column 8 of Lightner. Lightner teaches to use telephone lines to transfer digital signals but does not teach or suggest the use of telephone or telecommunication lines with respect to the transfer of money. As a matter of fact, Lightner teaches against the same since it calls for the sales to occur at the physical location of the vending machine. Moreover, the vending machine, is not in the possession of the second party who is receiving the digital signal. Thus, the second party does not have a second memory to which the digital signal is transferred. Only after transference is complete does the tape eject from the machine and become that of the customer. Also, Claim 23 has the term "setting electronically" rather than "transferring electronically money" which is directly supported by the original specification. Accordingly, Claim 23 is patentable over Lightner.

In view of the foregoing amendments and remarks, it is respectfully requested that the outstanding rejections and objections to this application be reconsidered and withdrawn, and Claims 11-13, 15, and 21-23, now in this application be allowed.

Respectfully submitted,

ARTHUR R. HAIR
